The U.S. Energy Outlook

for

Track II Energy Dialogue

New York, NY

September 11-12, 2014

by

Howard Gruenspecht, Deputy Administrator
U.S. energy use grows slowly over the projection reflecting steady growth in GDP offset by improving energy efficiency.

Source: EIA, Annual Energy Outlook 2014 Early Release
The U.S. has experienced a rapid increase in natural gas and oil production from shale and other tight resources.

U.S. tight oil production

- Million barrels of oil per day

U.S. dry shale gas production

- Billion cubic feet per day

Sources: EIA derived from state administrative data collected by DrillingInfo Inc. Data are through July 2014 and represent EIA’s official tight oil & shale gas estimates, but are not survey data. State abbreviations indicate primary state(s).
Resource and technology assumptions have major implications for projected U.S. crude oil production beyond the next few years.

Track II Energy Dialogue
September 11, 2014
Coal generation is reduced in a high gas availability case, but it does not gain much in a low gas availability case.

U.S. electricity net generation (trillion kilowatthours)

Natural gas is projected to surpass coal as the largest generation source more quickly under high oil and gas resource assumptions; proposed polices (not shown here) also affect the changeover.

Source: Annual Energy Outlook 2014 Reference case and High Oil and Gas Resource case
Key questions regarding the U.S. energy outlook

1. Which path (Reference or High Resource) best characterizes U.S. crude oil production growth over the next 5 to 10 years?

2. What is the impact of possible relaxation of limitations on hydrocarbon exports for production growth and markets?

3. What will EPA’s final rules for existing coal fired power plants look like, will they be delayed by legal challenges, and how will they be implemented by states?
China’s energy outlook – what I’d like to learn about

1. What is the outlook for China’s electricity demand growth rate over the next 5 to 10 years, and how might it be impacted by shifts towards a more consumer- and service-oriented economy?

2. What mix of the following strategies will be used to tackle coal-related local pollution: emissions controls, fuel switching, end-use demand cuts, and shifting coal use away from key cities through remotely-sited gasification or generation?

3. What is the outlook for fuel demand in China’s transportation sector given the likelihood that China remains the top global market for vehicle sales, resulting in a rapid rise in the number of vehicles in use?

4. How can outside observers assess the actual role of energy policies:
   – distinguish between binding policies and ideas that are under consideration
   – reconcile inconsistencies across various plans/policies
   – understand the role of different governmental levels in fashioning and implementing energy policies

5. What is the current view of prospects for shale gas in China?

Over time the electricity mix gradually shifts to lower-carbon options, led by growth in natural gas and renewable generation. 

Electricity net generation (trillion kilowatthours per year)

**Source:** EIA, Annual Energy Outlook 2014 Reference case
Gas-fueled units account for most projected capacity additions in the AEO2014 Reference case

U.S. electricity generation capacity additions

Source: Form EIA-860 & EIA Annual Energy Outlook 2014
The “crossover point” for least-cost dispatch of coal and natural gas capacity depends on both fuel prices and the carbon value; at lower natural gas prices, the “crossover” occurs at a lower carbon value.

Environmental operating costs and retrofit costs for pollution controls at existing coal-fired plants can “raise the bar” for their continued operation.

For retrofit decisions, the unit’s perceived “useful life,” which plays a critical role, can be affected by views regarding future climate policies.
An implicit or explicit carbon value growing at a 5% real rate has a major impact on the projected generation mix in *AEO2014*
